61-10208

Trans. of Bitumen Techn. Asphalte, Pecher und
Verwandte Stoffe (West Germany) 1955, v. 6 [no. 1]
p. 12-20.

The process of rupture of the closed binder film upon
immersion in water has been observed under the
microscope. First water penetrates through the closed
binder film to the solid body, where it collects in the
form of minute bubblets. In some binders, the thinner
film over such a bubblet then ruptures, thus giving the
water direct access to the solid. Then only is there
visible binder displacement (pushing aside), to a
greater or lesser extent depending on the binder.
